

Vibration Damped Turning Tools

Welcome to the MAQ-World!

At MAQ, our vision is simple yet revolutionary: “Simplify Machining.” With our groundbreaking plug-and-play technology, we eliminate vibrations from manufacturing processes, reducing production time and costs while enhancing product quality.

The Challenge: Vibration in Machining

Vibration during machining can result in damaged surfaces, broken cutting inserts, and skyrocketing production costs. This issue is particularly severe in operations requiring tools with a high length-to-diameter ratio (L/D), though even shorter overhang tools are not immune.

At the heart of the problem lies the variability of vibration frequencies. Cutting conditions like tool wear, joint deterioration, workpiece material variations, or setup changes can cause these frequencies to shift. Traditional vibration-damped tools rely on fixed tuning, which can worsen vibrations when the frequency moves outside their optimized range.

4th Generation –

Rubber rings with damping oil

5th Generation – from MAQ

Polymers with frequency dependent stiffness

The MAQ Solution: A Self-Tuning Revolution

MAQ tools are designed to adapt dynamically to these challenges. Our patented STMD™ (Self-Tuning Mass Dampener) technology uses innovative polymer spring elements that adjust their stiffness in real-time to match changing vibration frequencies. This unique self-tuning property ensures consistent performance, even under fluctuating machining conditions. The above picture illustrates our STMD technology versus the prior-art solution on the market.

The result? Superior surface finishes, tighter tolerances, enhanced process reliability, and significantly boosted productivity.

Why Choose MAQ Tools?

- **Simplicity Meets Ingenuity:** Our tools are easy to implement and outperform leading competitors.
- **Cost Savings:** Reduce tooling and overall machining costs while cutting down setup time and eliminating secondary operations.
- **High Efficiency:** No need for manual tuning—our tools do the work for you.

With MAQ, machining becomes effortless, efficient, and cost-effective. Join the movement to simplify machining and experience the MAQ difference today!

d – Carbide back end joined with steel
e – only on order and with a longer lead-time,
g - estimated with using standard SDUCR cutter heads from MAQ.

Turning 8-12xD

Straight holder (8-12xD) with fixed cutter heads (Metric)

L – nominal length
L_{min} – minimum total length after cutting
L_c – recommended clamping length 3 times diameter
D – diameter
WF – distance from cutting point to centre
OAL – overall length

C - Coolant through

b – measured from the cutting edge to the clamping.
d – Carbide back end joined with steel
e – only on order and with a longer lead time
g - estimated with using standard SDUCR cutter heads from MAQ.

Straight holder (8-12xD) with SL (Serration Lock) interface (Inch)

L – nominal length
L_{min} – minimum total length after cutting
L_c – recommended clamping length, 3 times diameter
D – diameter
PT – pipe thread
TD – thread depth

| a – delivery time 3 weeks |
| b – exchangeable to KM Lock i interface |
| c – measured from the cutting edge to the clamping. |
| g – estimated with standard KM Lock SDUCR cutter head |

Burnishing

Mirror surface finish in one pass, up to 15xD!

The MAQ diamond burnishing tool works on carbon steel, tool steel, cast iron, ferrous and non-ferrous (P, M, K, N, S) materials.

Suggested starting machining parameter to all materials:

- Interference with workpiece material 0.05-0.2 mm (0.002-0.003 inch)
- Cutting speed 60-230 m/min (200-750 SFM)
- Feed rate 0.08-0.15 mm/rev (0.003-0.006 IPR)

We recommend a feed rate at 70% of the feed rate in previous turning operation.

We recommend start with interference of 0.1 mm (0.004 µinch) and increase the interference if the surface finish is not reached.

Recommended surface finish prior burnishing operation is $Ra < 1.6 \mu\text{m}$ (64 µinch). After burnishing, the surface finish can normally reach $Ra < 0.3 \mu\text{m}$.

Diamond burnishing works well on STMD tools and can reach mirror surface finish up to 15xD setup.

Note: diamond burnishing normally has negligible impact on the size of the bore. A typical bore size change in burnishing of high alloy steel 4340 is within 10-15 µm (0.0004-0.0006 inch).

Diamond burnishing tools – Monoblock

LF – nominal length
Lmin – minimum total length after cutting
Lc – recommended clamping length, 3 times diameter
DCON – diameter of connection
WF – distance from cutting point to centre
PT – coolant inlet connection

Clamping of Turning tools

The clamping of the tool is very important in all operations but even more so when the overhang is long, i.e. high L/D -ratios. Please be aware that a weak clamping with low bending stiffness will have negative impact on the performance.

Direct Screw Mount:

- Unacceptable Bending Stiffness
- Clamping Length = N/A

Reduction Sleeve:

- Acceptable Bending Stiffness for low L/D
- Recommended Clamping Length = $>3xD$

All Around Clamp:

- Better Bending Stiffness
- Recommended Clamping Length = $>3xD$

Hydraulic Fixtures:

- Best Bending Stiffness (Recommended for high L/D)
- Recommended Clamping Length = $>2xD$

Vibration Damped Turning Tools
